CRKD

Alpha Test Cases: Review Against the System

Crooked Clothing Shop Test Cases (POS, Inventory and Forecasting) · Checked against the current code on 3 November 2026

Each of the 25 test cases was compared with what the system actually does. Numbers follow the order in the spreadsheet (test case 1 is row 5). **Reword** means the feature works but the steps or expected result describe it differently. **Gap** means part of the test asks for something the system doesn't have, so it will fail as written.

18	3	4
Aligned: the system does this as written	Reword: the system does it, but the wording or steps don't match	Gap: part of it isn't in the system yet

Name to use throughout: the spreadsheet's "Transaction Log" is the **Audit Logs** page in the sidebar.

Changes to make before testing

1. **Reword** Test case 6 (row 10): The sale is saved and stock updated right after clicking "Confirm Payment".
   Confirm Payment is followed by a Complete Sale confirmation. Add that click to step 1.
2. **Reword** Test case 12 (row 16): Color tags and low stock alerts are clear and easy to notice.
   The expected colors are wrong (low stock is yellow, red is out of stock), and there's no separate low-stock alert. Fix the expected result.
3. **Gap** Test case 14 (row 18): The screen is comfortable for long hours (text, FAQ, Dark Mode).
   The system has no FAQ. Remove the FAQ step, or add an FAQ page.
4. **Gap** Test case 20 (row 24): The Activity Log shows who logged in and what they did.
   Sales aren't written to the Activity Log. Change the action in step 1, or start logging sales.
5. **Gap** Test case 21 (row 25): Product and account changes show everywhere right away.
   The minimum stock level can't be edited; the forecast sets it. Remove it from step 1.
6. **Gap** Test case 22 (row 26): Error messages and logs are clear enough to tell what happened.
   Errors and failed logins aren't logged. Change step 3 to check the on-screen message, or start logging errors.
7. **Reword** Test case 24 (row 28): The layout works on other laptops, monitors and window sizes.
   Narrow windows (under 768 px) intentionally show a "use a larger screen" notice. Say so in the test.

All test cases

#	TEST OBJECTIVE	STATUS	WHAT THE SYSTEM DOES
1	Items can be added to the cart and a sale can be completed.	Aligned	Flow: Check Out, Payment Method, Cash or GCash, Confirm Payment, Complete Sale, then the receipt prompt.
2	Stock decreases after a sale and shows correctly on the Inventory page.	Aligned	Stock goes down when the sale is saved, and the Inventory page refreshes by itself.
3	Cash and GCash payments work correctly.	Aligned	The field is labelled "GCash reference number" (numbers only, up to 13 digits), not "Reference ID". Cash accepts up to ₱99,999.99.

#	TEST OBJECTIVE	STATUS	WHAT THE SYSTEM DOES
4	The system has all the features needed to run the shop.	Aligned	Products: add, edit, archive, restore. Staff Management: create, change password, archive and unarchive. The "Transaction Log" is the page called Audit Logs in the sidebar.
5	The POS page opens fast and adding items is quick.	Aligned	Clicking a product opens a size and color picker first, then Add to Checkout.
6	The sale is saved and stock updated right after clicking "Confirm Payment".	Reword	Confirm Payment opens a "Complete Sale" confirmation. The sale is only saved after clicking Complete Sale. **Suggested:** Step 1: Click "Confirm Payment", then "Complete Sale".
7	The weekly sales chart and the Forecasting page load smoothly.	Aligned	The chart is "Product Sales by Day" (last 7 days). Forecasting is a table, not a chart.
8	The system works on the browser the user uses.	Aligned	It's a plain web app; Chrome and Edge both work.
9	Numbers stay the same across POS, Inventory, Transaction Log and Dashboard.	Aligned	The owner's Dashboard shows units sold and today's revenue. The staff Dashboard shows total remaining stock and the out-of-stock count instead.
10	Users understand each menu and button without help.	Aligned	Opinion-based; nothing to change.
11	The system is easy to learn.	Aligned	Use "Audit Logs" when you ask testers to open the transaction log.
12	Color tags and low stock alerts are clear and easy to notice.	Reword	The expected result doesn't match: green is In stock, yellow is Low stock, red is Out of stock. There's no separate low-stock alert; the tag is the alert. "Minimum stock level" is the Threshold column, which the system sets by itself. **Suggested:** Expected: green "In stock", yellow "Low stock" and red "Out of stock" tags are clear and easy to notice.
13	The system warns or shows a clear message when the user makes a mistake.	Aligned	It asks before removing an item, cancelling the checkout and completing a sale, and shows messages for out of stock, an empty checkout and short cash.
14	The screen is comfortable for long hours (text, FAQ, Dark Mode).	Gap	Light and Dark mode are in the profile menu, but the system has no FAQ, so step 3 can't be done. **Suggested:** Remove step 3, or add an FAQ page before testing.
15	The system doesn't crash, freeze or show errors.	Aligned	Nothing to change.

#	TEST OBJECTIVE	STATUS	WHAT THE SYSTEM DOES
16	No sale is lost or counted twice when the page is refreshed mid-sale.	Aligned	The cart only lives on the page, so refreshing before payment clears it and nothing is saved or deducted. The payment button locks while saving, so a sale can't be sent twice. See the team note on the two-step save.
17	Past sales and stock records are still correct after logging out and in.	Aligned	Everything is kept in the database.
18	Only the owner can open Sales History, Forecasting and Staff Management.	Aligned	Staff are sent back to the Dashboard. Products and Exchanges are owner-only too; add them to the test.
19	The Master Recovery Key reset only works with the correct username and key.	Aligned	It's a pop-up from "Forgot password?" on the login page, not a separate page. A wrong key shows "Invalid Recovery Key!", a wrong username shows "Owner username not found.", and the new password must meet the password rules.
20	The Activity Log shows who logged in and what they did.	Gap	The Activity Log (owner Dashboard, latest 10 entries) records logins, password changes, staff archiving, exchanges and imports, but not sales. A sale shows in Audit Logs and Sales History with the cashier's name. **Suggested:** Step 3: Check the Activity Log for the staff login, and check Audit Logs for the sale and its cashier.
21	Product and account changes show everywhere right away.	Gap	Name and price edits, product archive and restore, and staff archive and unarchive all update open pages live. The minimum stock level (threshold) can't be edited by hand: the system sets it from the last 7 days of sales, at most once a week per product. **Suggested:** Step 1: Edit a product's name and price.
22	Error messages and logs are clear enough to tell what happened.	Gap	On-screen messages are clear (for example "Account archived or invalid credentials." and "Please fill in all three fields."). Failed logins and errors aren't recorded in the Activity Log, so step 3 finds nothing. **Suggested:** Step 3: Check that the message on screen explains what went wrong.
23	The system can be used without installing anything.	Aligned	It runs in the browser from the deployed site.
24	The layout works on other laptops, monitors and window sizes.	Reword	Windows narrower than 768 pixels show a "Please use a larger screen" notice by design, which a tester may count as a failure. **Suggested:** Precondition: keep the browser window at least 768 pixels wide (about half a laptop screen).
25	The system can fully replace handwritten notes and Messenger.	Aligned	Nothing to change.

Notes for the team

- **Test case 16:** a sale is saved in two steps (stock goes down, then the sale is recorded). If the connection drops between them, stock goes down with no sale recorded. Normal testing won't hit this.
- **Test case 18:** owner-only pages are blocked by the browser only; the server doesn't check the role.
- **Test case 19:** the master recovery key is written in the source code. Move it to a Railway variable and change it.
- **Test case 21:** live updates need the Supabase variables set on Railway; without them, other pages only update after a refresh.

Prepared from the CRKD source code (POS, Inventory, Products, Dashboard, Forecasting, Staff Management, Audit Logs and login).
